

Profhilo Treatment

Profhilo is used to rejuvenate the skin

As a result of age influence and environmental factors, the outer layers of the skin - the epidermis and dermis begin to lose elasticity and firmness, due to the loss of hyaluronic acid, collagen and elastin.

Profhilo is used for injection with minimal surgical intervention, minimal possible pain and the shortest session time to get the desired result as well as the shortest downtime. This makes Profhilo an easy-to-use and reassuring procedure.

How it works???

The process of restoring the skin to its elasticity takes place over four weeks after each session.

The product has been specially developed from both low and high molecular weight hyaluronic acid.

Profhilo uses hyaluronic acid of ultra pure degree and works by incorporating it into the skin tissue.

The skin's natural hyaluronic acid levels are restored. It aims to prevent a decrease in the amount of hyaluronic acid in the skin, and offers benefits such as:

- Restore skin elasticity
- Improve skin tone and hydration
- Skin texture enhancement
- Improve collagen level

The expected results

The procedure is usually done with two sessions with 4 weeks in between ... Some people need a third session.

Pain is very mild during the procedure and usually does not require prior anesthesia.

Profhilo can be used in many areas such as the face, neck, hands, arms, and even the upper chest area.

The process usually takes about 15-30 minutes.

After the first session, skin lines are improved and tightened gradually. Your skin will also look more hydrated and youthful.

In general, it is expected to increase tension and elasticity and improve the appearance of the skin while the results last for up to six months or more.

Care after the procedure

You can look forward to returning to your normal routine immediately after completing the procedure.

However, care must be taken during the first two days regarding:

- If there is swelling and discomfort, it is recommended to use ice packs for 5-10 minutes
- If Profhilo is used in the face, it is advised to avoid frequent contact with the treated area.
- It is recommended to stay away from sunlight and use an appropriate sun protection cream
- It is recommended to sleep while the face is facing up when the procedure is done late in the afternoon
- Ensure that the room is cold and airy generally
- It is advised to avoid eating too much table salt to avoid extra swelling at injection sites, and also to avoid drinking alcohol for the same
- It is advised to avoid contact with the treated area and avoid using make-up on it for 24 hours, in order to avoid infection with bacteria that may spread to the treated area.
- It is recommended to avoid strenuous exercise for 48 hours.
 - ***Results and benefits can vary and are different for each individual. Therefore our Clinic cannot guarantee specific results.**
